

## Darim's VT 600 Delivers Convenient USB Video Capture Solution to On-the-Go Professionals

### Quick-connect external device ushers in a new era in mobile video production and broadcasting

The ground-breaking VT600 Video Capture Express from Darim Vision now makes live capture, encoding, and streaming in real time available and affordable for the burgeoning user base of professionals and pro-sumers who need to record, edit, and transmit from the field.

“The Internet has opened up a vast new pool of broadcasting opportunities, especially for streaming live, on-site video,” observes Aaron Taylor, Darim Director of Sales. “Our next-generation VT600 hardware and software package combines USB connectivity with professional-grade features like SDI, CVBS, S-Video, and YUV input, and balanced audio, enabling users to extend their video communication capabilities without being tied to a production studio or even a desktop PC.”

Connecting to a notebook or laptop computer via high-speed USB 2.0, the VT600 captures data from various analog and digital audio and video sources. For direct broadcasting or transmission over a network or the Internet, uncompressed data can be easily encoded into web-based video using popular applications such as Adobe® Flash® Media Encoder, Microsoft® Windows Media™ Encoder, or Microsoft® Expression® Encoder 2 Express. Data can also be encoded for editing in a variety of formats--DV, DVC Pro, MJPEG, Flash/WM9, or H.264. Composite video and RCA audio output allow content to be previewed on a television screen for maximum effect.

“A user can spend the day shooting in the field, edit content on a notebook, and then broadcast the video from the remote location, just by adding our low-cost capture package,” Taylor points out.

“This kind of agile, efficient production empowers many different segments in the marketplace to create and deliver professional-caliber video content—without the expense of

complex studio equipment or high-powered servers.”

**About Darim Vision:** An international developer of video compression and transmission technologies, Darim Vision is committed to making video communication more accessible. Founded in 1991 and headquartered in Pleasanton, Calif., the company's sole focus has been to deliver tools and services that enhance the way people communicate in various market segments. Darim helps its customers succeed by continuously launching technologically advanced products in its principal business areas: MPEG Encoding, Streaming, Broadcasting, and Security.
